BreakFreeDNS

The best Apple blocking DNS to install unlimited IPAs

By using the DNS, you agree to the [TOS](#)
**Download the DNS [here](#)**

What is this?

BreakFree DNS is an open source DNS that **blocks Apple from catching you sideloading**. Unlike most DNSs, this one ensures no access is given by blocking **ppq.apple.com** and only enabling it temporarily on installation.

Therefore, with BreakFree DNS you can **install unlimited IPAs** and bypass Apple's annoying blacklists, completely for free. Furthermore, in BreakFree v2 (*coming soon*), you will be guided on how to install custom apps step-by-step, all for free.

How do I change DNS?

After installing the DNS profile, go to **Settings > General > VPN and Device management > DNS**. There, you can switch DNS.

When should I use Standard?
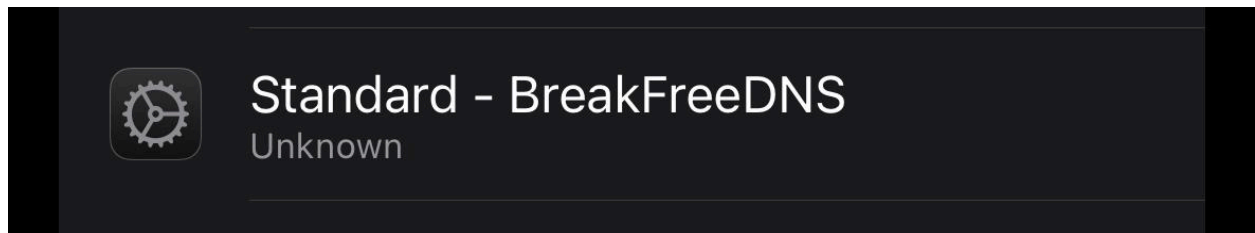

As the name suggests, "Standard" is the DNS you should **always** use. You should **never use VPNs** of any kind. Standard protects you from Apple's device tracking domains, especially by blocking the new **ppq.apple.com** domain. However, with this DNS, you cannot install apps.

When should I use Installation?
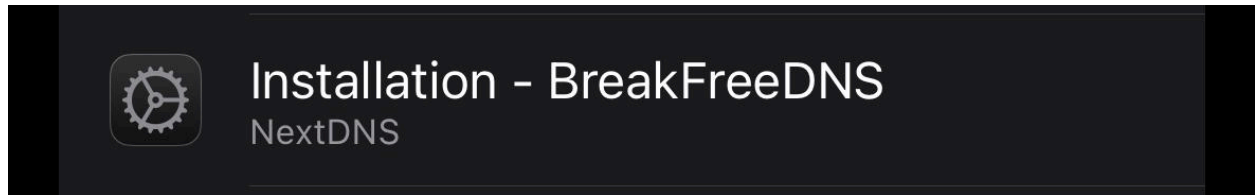

"Installation" is a DNS that blocks *most* Apple domains **but allows ppq.apple.com** in order for Apple to verify the enterprise certificate. You should **only use this while installing the app**, and you should d**isable it right after the application is installed on your iPhone/iPad**.

Is this DNS truly open source?

Yes, absolutely. This DNS as well as BreakFree as a whole project is made entirely for educational purposes, and the last thing I would like to do would be making sideloading a competition. To achieve that, I ensured to be fully transparent on how user data is collected and used in my [TOS](#), as well as releasing the [domain blocklist](#) to the public.
